# Ring-Closing Metathesis of Chiral Allylamines. Enantioselective Synthesis of (2S,3R,4S)-3,4-Dihydroxyproline 

Rubén Martín, Montserrat Alcón, Miquel A. Pericàs, and Antoni Riera*<br>Unitat de Recerca en Síntesi Asimètrica (URSA-PCB), Parc Científic de Barcelona and Departament de Química Orgànica, Universitat de Barcel ona, cl J osep Samitier, 1-5, 08028-Barcel ona, Spain<br>ariera@pcb.ub.es

Received April 17, 2002

The ring-closing metathesis (RCM) of two types of unsaturated chiral allylamines III, easily available from enantiomerically enriched epoxy alcohols, has been studied. Fully protected allylamines IIIa [ ${ }^{1} \mathrm{R}=\mathrm{CH}_{2}-\left(\mathrm{CH}_{2}\right)_{\mathrm{n}}-\mathrm{CH}=\mathrm{CH}_{2} ;{ }^{2} \mathrm{R}=\mathrm{Boc} ;{ }^{3} \mathrm{R}=\mathrm{PMB}$ ] have been prepared from unsaturated epoxy alcohols, whereas bis-allylamines IIIb ( ${ }^{1} \mathrm{R}=\mathrm{Ph},{ }^{2} \mathrm{R}=$ allyl, ${ }^{3} \mathrm{R}=\mathrm{Boc}$ or PMB ) have been prepared from 2,3-epoxy-3-phenylpropanol. Both types have been subjected to RCM to provide either cyclic allylamine I or II. The synthetic potential of these intermediates has been demonstrated by the enantioselective synthesis of (2S,3R,4S)-3,4-dihydroxyproline.

## Introduction

Polyhydroxylated cyclic amines are widespread in nature and exhibit multiple biological activities. Many of them such as polyhydroxypyrrolidines, ${ }^{1}$ polyhydroxypiperidines, ${ }^{2,3}$ or aminocyclitols ${ }^{4}$ are potent glycosidase inhibitors ${ }^{5,6}$ with potential therapeutic importance. AIthough the most usual access to these compounds is by functional group manipulation from carbohydrates, the development of practical asymmetric synthesis leading to them is a subject of great interest.

Dihydroxylation of unsaturated cyclic amines is a convenient entry to many polyhydroxylated alkaloids. Since ring-closing metathesis (RCM) ${ }^{7,8}$ has emerged as one of the most powerful reactions for the preparation of cycloalkenes, we envisaged that cyclic amines ${ }^{9,10}$ of generic structures I and II could be prepared from allylamines III bearing an appropriate unsaturated chain

[^0]in ${ }^{1} \mathrm{R}$ (IIIa) or ${ }^{2} \mathrm{R}$ (II\|b) (Figure 1). These allylamines, in turn, would be readily accessible in enantiopure form by deoxygenation of 3-amino-1,2-diols IV, ${ }^{11,12}$ arising from the regioselective ring-opening of Sharpless ${ }^{13}$ epoxy alcohols V with appropriate nitrogen nucleophiles. We describe herein the successful application of this strategy to the stereoselective preparation of several cyclic amines of structures I and II from enantiomerically enriched epoxy al cohols. Moreover, the synthetic potential of those intermediates is illustrated by the development of an

enantioselective synthesis of protected (2S,3R,4S)-3,4dihydroxyproline from (2S)-N-Boc-2-phenyl-2,5-dihydropyrrole

## Results and Discussion

Our approach to enantiopure dialkylami nocycloalkenes (I) is based on the preparation of chiral allylamines IIIa derived from unsaturated allyl alcohols. To this end, epoxy alcohols la-c of high enantiomeric excess (9194\% ee) were prepared by Sharpless catalytic epoxidation of the corresponding alkadienols and converted in high yield to the known N-Boc-N-(4'-methoxybenzyl)-3-amino-1,2-diols 2a-c by our previously described procedure, involving regioselective ring-opening with 4-methoxybenzylamine and subsequent protection with $\mathrm{Boc}_{2} \mathrm{O} \cdot{ }^{14}$ In

[^2]this event, by blocking both NH of the amino group we intended to avoid the potential deleterious effect of the secondary amine in the RCM, since it is known that a basic amine can inactivate the catalyst. ${ }^{15}$ Aminodiols $\mathbf{2 a}-\mathbf{c}$ bearing a fully protected amino group were deoxygenated with the Corey-Hopkins protocol. ${ }^{12}$ Thus, thionocarbonates $\mathbf{3 a}-\mathbf{c}$ were prepared in high yield by treatment with thiophosgene in the presence of 4-(dimethylamino)pyridine and subsequently heated at $60^{\circ} \mathrm{C}$ in 1,3-dimethyl-2-phenylphosphazolidine. In this way the pyrolysis took place smoothly affording bis-allylamines 4ac. With the bis-olefinic amines in hand, the RCM was performed with $2 \%$ mol of benzylidene (bis(tricyclohexyl)phosphine)ruthenium(II) dichloride (Grubbs's catalyst). ${ }^{7}$ The cyclopentene and cyclohexene amines 5b and 5c were obtained in excellent yield in what represents a straightforward synthesis of these intermediates of high enantiomeric purity. Not surprisingly, the attempted cyclization of 4a completely failed. In this case, most probably due to the strain of the cyclobutane ring, the starting material was completely recovered. Our projected preparation of enantiopure heterocyclic amines II involved chiral allylamines IIIb bearing an allyl fragment directly bonded to the amino group. We envisaged that these compounds could be easily prepared by using allylamine as a nucleophile in the epoxide ring-opening. We selected 2,3-epoxy-3-phenylpropanol (6) as starting material for two reasons: it is readily available in enantiopure form and the phenyl group is a known precursor of a carboxylic group. Thus, epoxyalcohol 6 of $>99 \%$ ee was prepared from cinnamyl alcohol by Sharpless epoxidation. ${ }^{13 a}$ Two well-establ ished protecting groups for the amino function, p-methoxybenzyl (PMB) and tertbutoxycarbonyl (Boc), were selected. The PMB group was tried first because the corresponding allylamines bearing it (i.e. N -allyl-p-methoxybenzylamine) are still very nucleophilic and consequently offered the advantage that they could be directly used as nucleophiles in the epoxide ring-opening. According to our expectations, the treatment of epoxy alcohol 6 with N -allyl-p-methoxybenzylamine under Sharpless conditions afforded aminodiol 7a in excellent yield (Scheme 2). However, due to the difficulties encountered in the dihydroxylation and in the deprotection of the PMB (vide infra), the Boc-protected aminodiol 7b was also prepared. The poor reactivity of N -Boc-allylamine prevented its introduction by nucleophilic ring opening so epoxide 6 was treated with allyl-

[^3]
## SCHEME 1

## SCHEME 2

amine in the presence of titanium tetraisopropoxide and the resulting aminodiol 8 was protected with $\mathrm{Boc}_{2} \mathrm{O}$ to afford 7b in good yield.

Both aminodiols 7a and 7b were submitted to the Corey-Hopkins protocol ${ }^{12}$ with the same reaction conditions as in the preparation of $\mathbf{4 a}-\mathbf{c}$, but the intermediate thionocarbonates were not characterized but used directly in the pyrolysis step. In both cases the deoxygenation took placein good yiel ds affording bis-allylamines 10a,b. These amines were treated with Grubbs's catalyst in $\mathrm{CH}_{2}{ }^{-}$ $\mathrm{Cl}_{2}$ at room temperature. In both cases pyrrolidines 11a,b were obtained in excellent yields. The enantiomeric purity of 11a,b was checked by DSC and, as expected, was in both cases >99\%. These compounds, like other related dehydropyrrolidines, are useful intermediates in the synthesis of heterocyclic compounds and some of them such as $\mathbf{1 1 b}$ have already been prepared. ${ }^{10}$ To further demonstrate their potential, we have used them as precursors in the synthesis of an important biologically active amino acid: 3,4-dihydroxyproline. ${ }^{16,17}$ The key steps for this synthesis would be the dihydroxylation of the double bond and the oxidation of the phenyl ring. After much experimentation we could neither dihydroxylate ${ }^{18}$ the p-methoxybenzyl derivative 11a nor deprotect the PMB group in acceptableyield. Gratifyingly, however, the dihydroxylation of $\mathbf{1 1 b}^{10 e}$ with $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}$ and a
catalytic amount of $\mathrm{OsO}_{4}$ took place in excellent yield and with compl ete facial selectivity, anti to the phenyl group. After protection of the diol as an acetonide, the phenyl group was oxidized with $\mathrm{NaIO}_{4}$ and a catalytic amount of ruthenium trichloride ${ }^{19}$ to afford the protected 3,4dihydroxyproline 146. This compound showed the same rotatory power as the product prepared from Zanardi and co-workers and their spectra were completely coincident. ${ }^{16 c}$ In summary, chiral allylamines III prepared by deoxygenation of 3-amino-1,2-diols have been tested in RCM reactions. Doubly olefinic compounds IIIa have been readily prepared from unsaturated epoxy alcohols, and their RCM has provided cyclic allylamines I in excellent yields and high enantiomeric purity. On the other hand, starting from 2,3-epoxycinnamyl alcohol, a nucleophilic ring opening by allylamines followed by a deoxygenation protocol afforded bis-allylamines IIIb, which upon RCM provided unsaturated pyrrolidines II also in excellent yields. One of these pyrrolidines has been used in the preparation of enantiomerically pure fully protected (2S,3R,4S)-3,4-di hydroxyproline.

## Experimental Section

General Methods. Optical rotations were measured at room temperature $\left(23^{\circ} \mathrm{C}\right.$ ) (concentration in $\mathrm{g} / 100 \mathrm{~mL}$ ). Infrared spectra were recorded with NaCl film. ${ }^{1} \mathrm{H}$ NMR were obtained at 200 or 300 MHz with tetramethylsilane as internal standard. ${ }^{13} \mathrm{C}$ NMR were obtained at 50.3 or 75.4 MHz in $\mathrm{DCCl}_{3}$,

[^4]
## SCHEME 3

and referenced to the solvent signal. Chemical shifts are recorded in ppm. Signal multiplicities have been assigned by DEPT experiments. Chromatographic separations were carried out with $\mathrm{NEt}_{3}$ pretreated ( $2.5 \% \mathrm{v} / \mathrm{v}$ ) $\mathrm{SiO}_{2}$ ( $70-230$ mesh). Compounds $\mathbf{2 a}-\mathbf{c}^{14}$ and $\mathbf{6}^{13 a}$ were prepared according to known procedures. All other compounds are novel except 11b ${ }^{10 e}$ and 14b. ${ }^{16 c}$
(4S,1'S)-N-(tert-Butoxycarbonyl)-N-(4-methoxybenzyl)-4-(1'-aminobut-3'-enyl)[1,3]dioxolane-2-thione (3a). To a stirred solution of $\mathbf{2 a}(1.25 \mathrm{~g}, 3.57 \mathrm{mmol})$ and 4-DMAP ( 1.05 $\mathrm{g}, 8.57 \mathrm{mmol})$ in dichloromethane ( 14.3 mL ) at $0^{\circ} \mathrm{C}$ under nitrogen was added thiophosgene ( $95 \%, 350 \mu \mathrm{~L}, 4.28 \mathrm{mmol}$ ). After 1 h of stirring at $0^{\circ} \mathrm{C}$, silica gel ( 7.14 g ) was added and the mixture was allowed to warm to $25^{\circ} \mathrm{C}$. Solvent was removed in vacuo, and the remaining solid was loaded onto a column of silica gel ( 21.4 g ) and eluted with $20 \%$ ethyl acetate in hexane to afford 1.17 g of thionocarbonate 3 a ( $84 \%$ yield) as an oil. $[\alpha]_{\mathrm{D}}+43.7$ (c $2.0, \mathrm{CHCl}_{3}$ ). IR (film) $v 3100,2977$, 1750, 1692, 1613, 1586, 1515, 1459, 1395, $1291 \mathrm{~cm}^{-1} .^{1} \mathrm{H}$ NMR $\left(200 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.17$ (d broad, 2H), $6.87(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}$, $2 \mathrm{H}), 5.7(\mathrm{~m}, 1 \mathrm{H}), 5.25-5.1(\mathrm{~m}, 2 \mathrm{H}), 5.1(\mathrm{~m}, 1 \mathrm{H}), 4.5-3.8(\mathrm{~m}$, 5H), $3.8(\mathrm{~s}, 3 \mathrm{H}), 2.61(\mathrm{~m}, 2 \mathrm{H}), 1.5(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 50 MHz , $\mathrm{CDCl}_{3}$ ) $\delta 159.3$ (C), 155 (C), 133.1 (CH), 129.2 (CH), 118.6 $(\mathrm{CH} 2), 114.3(\mathrm{CH}), 82.8(\mathrm{CH}), 81.0(\mathrm{C}), 71.8\left(\mathrm{CH}_{2}\right), 58.9(\mathrm{CH})$, $55.2\left(\mathrm{CH}_{3}\right), 50.3\left(\mathrm{CH}_{2}\right), 33.8\left(\mathrm{CH}_{2}\right), 28.3\left(\mathrm{CH}_{3}\right) . \mathrm{MS}\left(\mathrm{Cl}-\mathrm{NH}_{3}\right)$ m/e 295 ( $83 \%$ ), 394 ( $M+1,2 \%$ ), 395 ( $M+2,12 \%$ ), 411 ( $M+$ 18, 100\%).
(3S)-N-(tert-Butoxycarbonyl)-N-(4-methoxybenzyl)-(1-vinylbut-3-enyl)amine (4a). A suspension of thionocarbonate 3a ( $1.68 \mathrm{~g}, 4.27 \mathrm{mmol}$ ) in 1,3-dimethyl-2-phenyl-1,3,2-diazaphospholidine ( $2.3 \mathrm{~mL}, 12.8 \mathrm{mmol}$ ) was stirred under nitrogen for 20 h at $45^{\circ} \mathrm{C}$. After cooling to $25^{\circ} \mathrm{C}$, the contents were directly chromatographed on silica gel (elution with $2 \%$ ethyl acetate in hexane) to afford 850 mg of olefin $\mathbf{4 a}$ ( $63 \%$ yield) as an oil. [ $\alpha]_{D}-20.2$ (c 1.4, $\mathrm{CHCl}_{3}$ ). (1S)-N-Allyl-N-(tert-butoxycarbonyl)-1-phenylallylamine (10b). To a solution of $\mathbf{7 b}(1.4 \mathrm{~g}, 4.55 \mathrm{mmol})$ and 4 (dimethylamino)pyridine ( $1.33 \mathrm{~g}, 10.94 \mathrm{mmol}$ ) in anhydrous dichloromethane ( 25 mL ) at $0^{\circ} \mathrm{C}$ was added thiophosgene ( 0.47 $\mathrm{mL}, 5.46 \mathrm{mmol}$ ) slowly under nitrogen. The reaction mixture was stirred for 2 h , at which time TLC showed the reaction to be complete. Evaporation of the solvent (using a KOH trap) afforded a crude product (9b) that was used without further purification in the next step.

In a $50-\mathrm{mL}$ round-bottomed flask, the crude thiocarbonate ( $1.44 \mathrm{~g}, 4.12 \mathrm{mmol}$ ) and freshly distilled 1,3-dimethyl-2-phenyl[1,3,2]diazaphospholidine ( $2.4 \mathrm{~mL}, 12.41 \mathrm{mmol}$ ) were placed under nitrogen. The reaction mixture was warmed to $65{ }^{\circ} \mathrm{C}$ for 24 h . The residual crude was directly purified by column chromatography eluting with hexanes/ethyl acetate mixtures to yield $\mathbf{1 0 b}(0.86 \mathrm{~g}, 72 \%$ overall yield from $\mathbf{7 b}$ ) as a colorless oil. $[\alpha]^{23} \mathrm{D}-43.59$ (c 1.3, $\mathrm{CHCl}_{3}$ ). IR ( NaCl ) $v 2982,1691,1461$, $1402,1373,1264 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H} \mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.39-$ $7.29(\mathrm{~m}, 5 \mathrm{H}), 6.23-6.11(\mathrm{~m}, 1 \mathrm{H}), 5.62(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 5.39-5.22$ $(\mathrm{m}, 2 \mathrm{H}), 5.01(\mathrm{~d}, \mathrm{~J}=11.2 \mathrm{~Hz}, 2 \mathrm{H}), 3.86-3.69(\mathrm{~m}, 3 \mathrm{H}), 1.46(\mathrm{~s}$, $9 \mathrm{H}){ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 155.55$ (CO), 140.09 (C), $135.71(\mathrm{CH}), 135.3(\mathrm{CH}), 128.25(\mathrm{CH}), 127.71(\mathrm{CH}), 127.2(\mathrm{CH})$, $117.83\left(\mathrm{CH}_{2}\right), 115.9\left(\mathrm{CH}_{2}\right), 79.92(\mathrm{CH}), 61.88(\mathrm{C}), 47.72\left(\mathrm{CH}_{2}\right)$, $28.37\left(\mathrm{CH}_{3}\right) . \mathrm{MS}\left(\mathrm{CI}-\mathrm{NH}_{3}\right) \mathrm{m} / \mathrm{z}(\%) 274$ (100) $[\mathrm{M}+1]^{+}, 291$ (41) $[\mathrm{M}+18]^{+}$. HRMS (CI) calcd for $\mathrm{C}_{17} \mathrm{H}_{23} \mathrm{NO}_{2}\left(\mathrm{M}^{+}\right)$273.1729, found 273.1746.
(2S)-N-tert-Butoxycarbonyl-2-phenyl-2,5-dihydropyrrole (11b). To a solution of 10b ( $0.72 \mathrm{~g}, 2.64 \mathrm{mmol}$ ) in anhydrous dichloromethane was added Grubbs's catalyst (0.11 $\mathrm{g}, 5 \% \mathrm{~mol}$ ) dropwise under nitrogen. The resulting mixture was stirred at room temperature. When the reaction was complete by TLC (ca. 1 h ), the reaction mixture was concentrated and chromatographed eluting with hexanes/ethyl acetate mixtures to afford 11b ( $0.63 \mathrm{~g}, 99 \%$ yield) as a white solid. $[\alpha]^{233_{\mathrm{D}}}-280.5\left(\mathrm{c} 1.0, \mathrm{CHCl}_{3}\right)$. IR ( NaCl ) $v 3021,1705,1645$ $\mathrm{cm}^{-1} .{ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}, 55^{\circ} \mathrm{C}\right) \delta 7.32-7.19(\mathrm{~m}, 5 \mathrm{H})$, $5.87(\mathrm{~s}, 1 \mathrm{H}), 5.73(\mathrm{~s}, 1 \mathrm{H}), 5.37(\mathrm{~s}, 1 \mathrm{H}), 4.33(\mathrm{~s}, 2 \mathrm{H}), 1.21(\mathrm{~s}$, $9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}, 55^{\circ} \mathrm{C}$ ) $\delta 154.67$ (CO), 140.14
(C), 131.34 (CH), 128.24 (CH), $127.21(\mathrm{CH}), 126.67(\mathrm{CH})$, $124.61(\mathrm{CH}), 79.54(\mathrm{CH}), 64.93(\mathrm{C}), 48.13\left(\mathrm{CH}_{2}\right), 28.28\left(\mathrm{CH}_{3}\right)$. MS ( $\mathrm{Cl}-\mathrm{NH}_{3}$ ) m/z (\%) $246(90)[\mathrm{M}+1]^{+}, 263(100)[\mathrm{M}+18]^{+}$. Purity by DSC: $99.5 \%\left(\mathrm{mp} 81.01{ }^{\circ} \mathrm{C}\right.$ ). Anal. Calcd for $\mathrm{C}_{15} \mathrm{H}_{19}{ }^{-}$ $\mathrm{NO}_{2}$ : C, 73.44; H, 7.81; N, 5.71. Found: C, 73.45; H, 7.72; N, 5.65 .
(2R,3R,4S)-N-tert-Butoxycarbonyl-3,4-dihydroxy-2-phenylpyrrolidine (12b). To a solution of $\mathbf{1 1 b}$ ( $0.1 \mathrm{~g}, 0.41 \mathrm{mmol}$ ) in ${ }^{5} \mathrm{BuOH}(3 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(3 \mathrm{~mL})$ were added potassium hexacyanoferrate $(0.403 \mathrm{~g})$ and $\mathrm{K}_{2} \mathrm{CO}_{3}(0.167 \mathrm{~g})$. The mixture was stirred for 15 min at room temperature and a sol ution of $\mathrm{OsO}_{4}$ ( $0.1 \mathrm{~mL}, 0.051 \mathrm{mM}$ in ${ }^{\mathrm{t}} \mathrm{BuOH}$ ) was added slowly. After 24 h of stirring the reaction was complete by TLC. $\mathrm{Et}_{2} \mathrm{O}$ (2 mL ) was added and the aqueous layer was extracted with ethyl ether. The combined organic layers were washed with brine and dried $\left(\mathrm{MgSO}_{4}\right)$. The solvent was removed in vacuo to give 12b ( $0.113 \mathrm{~g}, 99 \%$ yield) as a colorless oil. $[\alpha]^{23} \mathrm{D}-16.2$ (c 1.6, $\mathrm{CHCl}_{3}$ ). IR ( NaCl ) $v 3434,2979,1700,1399 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}, 55^{\circ} \mathrm{C}$ ) $\delta 7.33-7.15(\mathrm{~m}, 5 \mathrm{H}), 4.61(\mathrm{br} \mathrm{s}, 1 \mathrm{H})$, 4.22 (dd, J = 7.3, 3.3 Hz, 1H ), $3.99(\mathrm{~m}, 1 \mathrm{H}), 3.73(\mathrm{dd}, \mathrm{J}=11.7$, $5.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.64(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 3.21(\mathrm{br} \mathrm{s}, 2 \mathrm{H}), 1.24(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}, 55^{\circ} \mathrm{C}$ ) $\delta 154.8$ (CO), 140.2 (C), 128.5 (CH), 127.1 (CH ), 125.7 (CH), $80.0(\mathrm{CH}), 69.6(\mathrm{CH}), 66.9(\mathrm{CH})$, $61.4(\mathrm{C}), 51.4\left(\mathrm{CH}_{2}\right), 28.2\left(\mathrm{CH}_{3}\right) . \mathrm{MS}\left(\mathrm{CI}-\mathrm{NH}_{3}\right) \mathrm{m} / \mathrm{z}(\%) 280$ (86) $[M+1]^{+}, 297(100)[M+18]^{+}$. (2S,3R,4S)-N-tert-Butoxycarbonyl-3,4-di hydroxyproline Isopropylidene Acetal (14b). A $50-\mathrm{mL}$, three-necked, round-bottomed flask equipped with a wide-bore gas outlet (because the generation of carbon dioxide) was charged with 13b ( $100 \mathrm{mg}, 0.32 \mathrm{mmol}$ ), carbon tetrachloride ( 2.2 mL ), acetonitrile ( 2.2 mL ), water ( 4.5 mL ), and sodium bicarbonate $(0.45 \mathrm{~g}, 5.35 \mathrm{mmol})$. The mixture was briefly stirred until both phases were clear. Sodium periodate ( $1.22 \mathrm{~g}, 6.28 \mathrm{mmol}$ ) was added and the mixture stirred for 15 min . Ruthenium trichloride hydrate ( $8 \mathrm{mg}, 10 \% \mathrm{~mol}$ ) was added and the mixture vigorously stirred for 55 h . Then, diethyl ether ( 3 mL ) was added (a deep black color appeared at this point) at $0^{\circ} \mathrm{C}$ with vigorous stirring. After 10 min the organic phase was separated and the aqueous layer extracted with ether. The combined organic layers were washed with brine, dried, filtered, and concentrated. The crude product was purified by column chromatography eluting with methanol/dichloromethane mixtures to afford pure $\mathbf{1 4 b}$ ( $53 \mathrm{mg}, 59 \%$ yield) as a colorless oil. $[\alpha]^{23 \mathrm{~B}_{\mathrm{D}}}-44.1$. ( $\mathrm{C} 0.07, \mathrm{CHCl}_{3}$ ). IR ( NaCl ) $v 3433,1745,1581$ $\mathrm{cm}^{-1} .^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.19(\mathrm{bs}, 1 \mathrm{H}), 4.78(\mathrm{~m}, 2 \mathrm{H})$, $4.43(\mathrm{~m}, 1 \mathrm{H}), 3.77(\mathrm{~m}, 2 \mathrm{H}), 1.48(\mathrm{~s}, 9 \mathrm{H}), 1.42(\mathrm{~s}, 3 \mathrm{H}), 1.29(\mathrm{~s}$, $3 \mathrm{H}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 172.3$ (CO), 154.1 (CO), 111.8 (CH), $82.3(\mathrm{CH}), 81.4(\mathrm{CH}), 80.3(\mathrm{C}), 66.9(\mathrm{C}), 52.1\left(\mathrm{CH}_{2}\right), 28.5$ $\left(\mathrm{CH}_{3}\right), 26.8\left(\mathrm{CH}_{3}\right), 25.1\left(\mathrm{CH}_{3}\right) . \mathrm{MS}\left(\mathrm{CI}-\mathrm{NH}_{3}\right) \mathrm{m} / \mathrm{z}(\%) 288(47)$ $[M+1]^{+}, 305(100)[M+18]^{+}$. Anal. Calcd for $\mathrm{C}_{13} \mathrm{H}_{21} \mathrm{NO}_{6}: \mathrm{C}$, 54.35; H, 7.37; N, 4.88. Found: C, 54.27; H, 7.41; N, 4.81.
